ANDROID PROGRAMMING PRACTICAL 02

Module 2 · AlertDialog and custom DialogFragment

Aim

Demonstrate AlertDialog and a custom DialogFragment.

Project name: DialogDemo

Requirements

Android Studio, Java, Android SDK, and an Android Virtual Device or compatible Android phone. Use the package name generated by your project and adjust imports/dependencies to the installed Android Studio template.

Procedure

1. Create an activity layout with buttons for Show AlertDialog and Show Custom Dialog.

2. Attach an OnClickListener to the alert button and build an AlertDialog with title, message, positive, and negative actions.

3. Create dialog_custom.xml with a title and an EditText input.

4. Create CustomDialogFragment extending DialogFragment and inflate dialog_custom.xml in onCreateDialog().

5. Add Submit and Cancel actions; read the input on Submit and dismiss on Cancel.

6. Show the fragment with getSupportFragmentManager() and a tag.

7. Run the app and verify both the confirmation dialog and custom input dialog work.

Implementation checklist

• Keep resource names lowercase and use unique view IDs.

• Make sure every referenced layout, menu, drawable, string, or Java class exists in the project.

• Build the project and resolve compile errors before running it.

• Use Logcat to diagnose runtime errors and permissions or manifest issues.

Expected result

The standard alert and custom DialogFragment both open and respond to button/input actions.

Testing / observations

Record the device/API level, the actions tested, the observed output, and any errors corrected. Attach a screenshot of the successful run to your practical record if required by your institution.

Conclusion

The stated Android concept was implemented and verified through the steps and tests above.
