ANDROID PROGRAMMING PRACTICAL 06

Module 2 · Populate Spinner or ListView dynamically using Adapters

Aim

Use adapters to populate Spinner or ListView dynamically.

Project name: AdapterDemo

Requirements

Android Studio, Java, Android SDK, and an Android Virtual Device or compatible Android phone. Use the package name generated by your project and adjust imports/dependencies to the installed Android Studio template.

Procedure

1. Add a Spinner and/or ListView to activity_main.xml.

2. Create a String array or ArrayList with sample values such as cities.

3. Create an ArrayAdapter with the appropriate Android row layout and data.

4. Set the adapter on the Spinner and ListView.

5. Register an OnItemSelectedListener for Spinner and an OnItemClickListener for ListView.

6. Show the selected/clicked value using Toast or a result TextView.

7. Run the app, change the Spinner selection, and tap ListView rows to verify the adapter data is bound dynamically.

Implementation checklist

• Keep resource names lowercase and use unique view IDs.

• Make sure every referenced layout, menu, drawable, string, or Java class exists in the project.

• Build the project and resolve compile errors before running it.

• Use Logcat to diagnose runtime errors and permissions or manifest issues.

Expected result

Spinner/ListView items are populated from data and selection events are handled.

Testing / observations

Record the device/API level, the actions tested, the observed output, and any errors corrected. Attach a screenshot of the successful run to your practical record if required by your institution.

Conclusion

The stated Android concept was implemented and verified through the steps and tests above.
