ANDROID PROGRAMMING PRACTICAL 07

Module 1 · LinearLayout horizontal and vertical UI

Aim

Use LinearLayout in horizontal and vertical orientations to design a structured UI.

Project name: LinearLayoutDemo

Requirements

Android Studio, Java, Android SDK, and an Android Virtual Device or compatible Android phone. Use the package name generated by your project and adjust imports/dependencies to the installed Android Studio template.

Procedure

1. Create an Empty Views Activity project.

2. Use a vertical LinearLayout as the root and set width/height to match_parent.

3. Add a heading and input fields using wrap_content or match_parent widths as appropriate.

4. Add a nested horizontal LinearLayout containing Submit and Reset buttons.

5. Set padding, margins, gravity, and layout weights where useful.

6. In MainActivity, wire Submit to validate/read fields and Reset to clear them.

7. Run on an emulator and verify the layout remains readable in portrait orientation.

Implementation checklist

• Keep resource names lowercase and use unique view IDs.

• Make sure every referenced layout, menu, drawable, string, or Java class exists in the project.

• Build the project and resolve compile errors before running it.

• Use Logcat to diagnose runtime errors and permissions or manifest issues.

Expected result

The form is arranged with vertical and horizontal LinearLayout sections and buttons respond.

Testing / observations

Record the device/API level, the actions tested, the observed output, and any errors corrected. Attach a screenshot of the successful run to your practical record if required by your institution.

Conclusion

The stated Android concept was implemented and verified through the steps and tests above.
