ANDROID PROGRAMMING PRACTICAL 07

Module 2 · Started and Bound Services

Aim

Implement Started and Bound Services.

Project name: ServiceDemo

Requirements

Android Studio, Java, Android SDK, and an Android Virtual Device or compatible Android phone. Use the package name generated by your project and adjust imports/dependencies to the installed Android Studio template.

Procedure

1. Create MainActivity with Start Service, Stop Service, and Bind Service controls.

2. Create MyStartedService extending Service; implement onStartCommand(), onDestroy(), and onBind() returning null for a started-only service.

3. Create MyBoundService extending Service and expose a Binder that returns the service instance.

4. Implement a method such as getMessage() in MyBoundService.

5. Declare both services inside the application element of AndroidManifest.xml.

6. Call startService()/stopService() for the started service and bindService() for the bound service.

7. Track binding state and call unbindService() when the Activity is destroyed; test start, stop, bind, and disconnect behavior.

Implementation checklist

• Keep resource names lowercase and use unique view IDs.

• Make sure every referenced layout, menu, drawable, string, or Java class exists in the project.

• Build the project and resolve compile errors before running it.

• Use Logcat to diagnose runtime errors and permissions or manifest issues.

Expected result

The started service can be started/stopped and the bound service returns a message while connected.

Testing / observations

Record the device/API level, the actions tested, the observed output, and any errors corrected. Attach a screenshot of the successful run to your practical record if required by your institution.

Conclusion

The stated Android concept was implemented and verified through the steps and tests above.
