# ANDROID PROGRAMMING PRACTICAL 09

## Module 1 · TableLayout login/registration form

### Aim

Use TableLayout to design a structured login or registration form.

**Project name**: TableLayoutFormDemo

### Requirements

Android Studio, Java, Android SDK, and an Android Virtual Device or compatible Android phone. Use the package name generated by your project and adjust imports/dependencies to the installed Android Studio template.

### Procedure

**1.** Create an Empty Views Activity project.

**2.** Set a TableLayout as the root or place it inside a suitable parent layout.

**3.** Create TableRow elements for labels and input fields such as Name, Email, and Password.

**4.** Use EditText inputType values appropriate to each field and provide meaningful hints.

**5.** Add a final TableRow with Submit and Reset buttons.

**6.** In MainActivity, read the fields, validate required values, and show a success/error Toast.

**7.** Run the app and test both valid and empty submissions.

### Implementation checklist

• Keep resource names lowercase and use unique view IDs.

• Make sure every referenced layout, menu, drawable, string, or Java class exists in the project.

• Build the project and resolve compile errors before running it.

• Use Logcat to diagnose runtime errors and permissions or manifest issues.

### Expected result

The form is laid out in rows and validates required input.

### Testing / observations

Record the device/API level, the actions tested, the observed output, and any errors corrected. Attach a screenshot of the successful run to your practical record if required by your institution.

### Conclusion

The stated Android concept was implemented and verified through the steps and tests above.
