ANDROID PROGRAMMING PRACTICAL 10

Module 1 · ScrollView long content

Aim

Use ScrollView to display long scrollable content.

Project name: ScrollViewDemo

Requirements

Android Studio, Java, Android SDK, and an Android Virtual Device or compatible Android phone. Use the package name generated by your project and adjust imports/dependencies to the installed Android Studio template.

Procedure

1. Create an Empty Views Activity project.

2. Add a ScrollView as the root content container with match_parent dimensions.

3. Place exactly one direct child inside ScrollView, typically a vertical LinearLayout.

4. Add multiple TextViews or cards to make content longer than the screen.

5. Set padding and spacing so content is readable.

6. Run the app on the emulator and swipe vertically to confirm all content is reachable.

7. Check that nested scrolling containers are avoided unless deliberately required.

Implementation checklist

• Keep resource names lowercase and use unique view IDs.

• Make sure every referenced layout, menu, drawable, string, or Java class exists in the project.

• Build the project and resolve compile errors before running it.

• Use Logcat to diagnose runtime errors and permissions or manifest issues.

Expected result

The user can scroll through content that extends beyond the screen.

Testing / observations

Record the device/API level, the actions tested, the observed output, and any errors corrected. Attach a screenshot of the successful run to your practical record if required by your institution.

Conclusion

The stated Android concept was implemented and verified through the steps and tests above.
