ANDROID PROGRAMMING PRACTICAL 11

Module 1 · AbsoluteLayout fixed positioning

Aim

Demonstrate fixed positioning using AbsoluteLayout.

Project name: AbsoluteLayoutDemo

Requirements

Android Studio, Java, Android SDK, and an Android Virtual Device or compatible Android phone. Use the package name generated by your project and adjust imports/dependencies to the installed Android Studio template.

Procedure

1. Create an Empty Views Activity project.

2. Add an AbsoluteLayout and place a few simple views with layout_x and layout_y coordinates.

3. Run the app on the specified emulator to observe coordinate-based placement.

4. Record how positions are fixed relative to the layout origin.

5. Resize the emulator or change orientation and observe clipping/misalignment.

6. Explain in the practical record that AbsoluteLayout is deprecated and unsuitable for responsive production layouts; use it only to demonstrate the syllabus concept.

7. Capture or record the output and note the limitations observed.

Implementation checklist

• Keep resource names lowercase and use unique view IDs.

• Make sure every referenced layout, menu, drawable, string, or Java class exists in the project.

• Build the project and resolve compile errors before running it.

• Use Logcat to diagnose runtime errors and permissions or manifest issues.

Expected result

Views appear at the configured fixed coordinates; limitations on different screen sizes are visible.

Testing / observations

Record the device/API level, the actions tested, the observed output, and any errors corrected. Attach a screenshot of the successful run to your practical record if required by your institution.

Conclusion

The stated Android concept was implemented and verified through the steps and tests above.
