ANDROID PROGRAMMING PRACTICAL 12

Module 1 · FrameLayout overlay UI elements

Aim

Use FrameLayout to overlay UI elements.

Project name: FrameLayoutOverlayDemo

Requirements

Android Studio, Java, Android SDK, and an Android Virtual Device or compatible Android phone. Use the package name generated by your project and adjust imports/dependencies to the installed Android Studio template.

Procedure

1. Create an Empty Views Activity project.

2. Set FrameLayout as the root container.

3. Add a background ImageView or colored View that fills the parent.

4. Add a TextView or Button after the background view so it appears above it in the stacking order.

5. Use layout_gravity to position the overlay at the center or a corner.

6. Run the app and verify the foreground element overlays the background.

7. Experiment with child order and gravity to understand Z-order.

Implementation checklist

• Keep resource names lowercase and use unique view IDs.

• Make sure every referenced layout, menu, drawable, string, or Java class exists in the project.

• Build the project and resolve compile errors before running it.

• Use Logcat to diagnose runtime errors and permissions or manifest issues.

Expected result

Foreground UI elements are visibly layered above the FrameLayout background.

Testing / observations

Record the device/API level, the actions tested, the observed output, and any errors corrected. Attach a screenshot of the successful run to your practical record if required by your institution.

Conclusion

The stated Android concept was implemented and verified through the steps and tests above.
