ANDROID PROGRAMMING PRACTICAL 13

Module 1 · ListView with ArrayAdapter and item click

Aim

Use ListView with ArrayAdapter and implement item-click handling.

Project name: ListViewAdapterDemo

Requirements

Android Studio, Java, Android SDK, and an Android Virtual Device or compatible Android phone. Use the package name generated by your project and adjust imports/dependencies to the installed Android Studio template.

Procedure

1. Create an Empty Views Activity project and add a ListView to activity_main.xml.

2. Prepare a String array or ArrayList containing sample items.

3. Create an ArrayAdapter using android.R.layout.simple_list_item_1 and the data collection.

4. Set the adapter on the ListView in MainActivity.

5. Register setOnItemClickListener() and use the selected position to identify the item.

6. Show the selected item using Toast or update a TextView.

7. Run the app and tap several list rows to verify selection handling.

Implementation checklist

• Keep resource names lowercase and use unique view IDs.

• Make sure every referenced layout, menu, drawable, string, or Java class exists in the project.

• Build the project and resolve compile errors before running it.

• Use Logcat to diagnose runtime errors and permissions or manifest issues.

Expected result

List items are displayed and tapping a row reports the selected item.

Testing / observations

Record the device/API level, the actions tested, the observed output, and any errors corrected. Attach a screenshot of the successful run to your practical record if required by your institution.

Conclusion

The stated Android concept was implemented and verified through the steps and tests above.
